Quasi-Newton methods for minimization

The symmetric rank one update

## Outline

- Quasi Newton Method
   The symmetric rank one update
   The Powell-symmetric-Broyden update
   The Davidon Fletcher and Powell rank 2 update
  - 5 The Broyden Fletcher Goldfarb and Shanno (BFGS) update
  - 6 The Broyden class

3 / 63

• Let  $B_k$  and approximation of the Hessian of f(x). Let  $x_k$ ,  $x_{k+1}$ ,  $g_k$  and  $g_{k+1}$  and if we use the Broyden update formula to force secant condition to  $B_{k+1}$  we obtain

$$oldsymbol{B}_{k+1} \leftarrow oldsymbol{B}_k + rac{(oldsymbol{y}_k - oldsymbol{B}_k oldsymbol{s}_k) oldsymbol{s}_k^T}{oldsymbol{s}_k^T oldsymbol{s}_k},$$

where  $s_k = x_{k+1} - x_k$  and  $y_k = g_{k+1} - g_k$ . By using Sherman–Morrison formula and setting  $H_k = B_k^{-1}$  we obtain the update:

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k - rac{(oldsymbol{H}_k oldsymbol{y}_k - oldsymbol{s}_k)oldsymbol{s}_k^T}{oldsymbol{s}_k^T oldsymbol{s}_k + oldsymbol{s}_k^T oldsymbol{H}_k oldsymbol{g}_{k+1}}oldsymbol{H}_k$$

The previous update do not maintain symmetry. In fact if *H<sub>k</sub>* is symmetric then *H<sub>k+1</sub>* not necessarily is symmetric.

<ロト < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Quasi-Newton methods for minimization

The symmetric rank one update

• To avoid loss of symmetry we can consider an update of the form:

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k + oldsymbol{u}oldsymbol{u}^T$$

• Imposing the secant condition (on the inverse)

$$oldsymbol{H}_{k+1}oldsymbol{y}_k = oldsymbol{s}_k \qquad \Rightarrow \qquad oldsymbol{H}_koldsymbol{y}_k + oldsymbol{u}oldsymbol{u}^Toldsymbol{y}_k = oldsymbol{s}_k$$

from previous equality

$$egin{aligned} oldsymbol{y}_k^Toldsymbol{H}_koldsymbol{y}_k + oldsymbol{y}_k^Toldsymbol{u} u^Toldsymbol{y}_k = oldsymbol{y}_k^Toldsymbol{s}_k &\Rightarrow \ oldsymbol{y}_k^Toldsymbol{u} = ig(oldsymbol{y}_k^Toldsymbol{s}_k - oldsymbol{y}_k^Toldsymbol{H}_koldsymbol{y}_k ig)^{1/2} \end{aligned}$$

we obtain

$$oldsymbol{u} = rac{oldsymbol{s}_k - oldsymbol{H}_k oldsymbol{y}_k}{oldsymbol{u}^T oldsymbol{y}_k} = rac{oldsymbol{s}_k - oldsymbol{H}_k oldsymbol{y}_k}{ig(oldsymbol{y}_k^T oldsymbol{s}_k - oldsymbol{y}_k^T oldsymbol{H}_k oldsymbol{y}_kig)^{1/2}}$$

< □ > < /□ >

ullet substituting the expression of u

$$oldsymbol{u} = rac{oldsymbol{s}_k - oldsymbol{H}_k oldsymbol{y}_k}{ig(oldsymbol{y}_k^T oldsymbol{s}_k - oldsymbol{y}_k^T oldsymbol{H}_k oldsymbol{y}_kig)^{1/2}}$$

in the update formula, we obtain

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k + rac{oldsymbol{w}_k oldsymbol{w}_k^T}{oldsymbol{w}_k^T oldsymbol{y}_k} \qquad oldsymbol{w}_k = oldsymbol{s}_k - oldsymbol{H}_k oldsymbol{y}_k$$

- The previous update formula is the symmetric rank one formula (SR1).
- To be definite the previous formula needs  $\boldsymbol{w}_k^T \boldsymbol{y}_k \neq 0$ . Moreover if  $\boldsymbol{w}_k^T \boldsymbol{y}_k < 0$  and  $\boldsymbol{H}_k$  is positive definite then  $\boldsymbol{H}_{k+1}$  not necessarily is positive definite.

▲□▶ ▲圖▶ ▲ 圖▶ ▲ 圖▶

• Have  $H_k$  symmetric and positive definite is important for global convergence

Quasi-Newton methods for minimization

The symmetric rank one update

This lemma is used in the forward theorems

#### Lemma

Let be

$$q(\boldsymbol{x}) = \frac{1}{2}\boldsymbol{x}^T \boldsymbol{A} \boldsymbol{x} - \boldsymbol{b}^T \boldsymbol{x} + c$$

with  $oldsymbol{A} \in \mathbb{R}^{n imes n}$  symmetric and positive definite. Then

$$egin{aligned} oldsymbol{y}_k &= oldsymbol{g}_{k+1} - oldsymbol{g}_k \ &= oldsymbol{A} oldsymbol{x}_{k+1} - oldsymbol{b} - oldsymbol{A} oldsymbol{x}_k + oldsymbol{b} \ &= oldsymbol{A} oldsymbol{s}_k \end{aligned}$$

where  $oldsymbol{g}_k = 
abla \mathsf{q}(oldsymbol{x}_k)^T.$ 

#### Theorem (property of SR1 update)

Let be

$$q(x) = \frac{1}{2}x^T A x - b^T x + c$$

with  $A \in \mathbb{R}^{n \times n}$  symmetric and positive definite. Let be  $x_0$  and  $H_0$  assigned. Let  $x_k$  and  $H_k$  produced by

①  $oldsymbol{x}_{k+1} = oldsymbol{x}_k + oldsymbol{s}_k;$ 

**2**  $H_{k+1}$  updated by the SR1 formula

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k + rac{oldsymbol{w}_k oldsymbol{w}_k^T}{oldsymbol{w}_k^T oldsymbol{y}_k} \qquad oldsymbol{w}_k = oldsymbol{s}_k - oldsymbol{H}_k oldsymbol{y}_k$$

▲□▶ ▲圖▶ ▲厘▶ ▲厘▶

If  $s_0$ ,  $s_1$ , ...,  $s_{n-1}$  are linearly independent then  $H_n = A^{-1}$ .

Quasi-Newton methods for minimization

The symmetric rank one update

#### Proof.

We prove by induction the hereditary property  $H_i y_j = s_j$ . BASE: For i = 1 is exactly the secant condition of the update. INDUCTION: Suppose the relation is valid for k > 0 the we prove that it is valid for k + 1. In fact, from the update formula

$$oldsymbol{H}_{k+1}oldsymbol{y}_j = oldsymbol{H}_koldsymbol{y}_j + rac{oldsymbol{w}_k^Toldsymbol{y}_j}{oldsymbol{w}_k^Toldsymbol{y}_k}oldsymbol{w}_k \qquad oldsymbol{w}_k = oldsymbol{s}_k - oldsymbol{H}_koldsymbol{y}_k$$

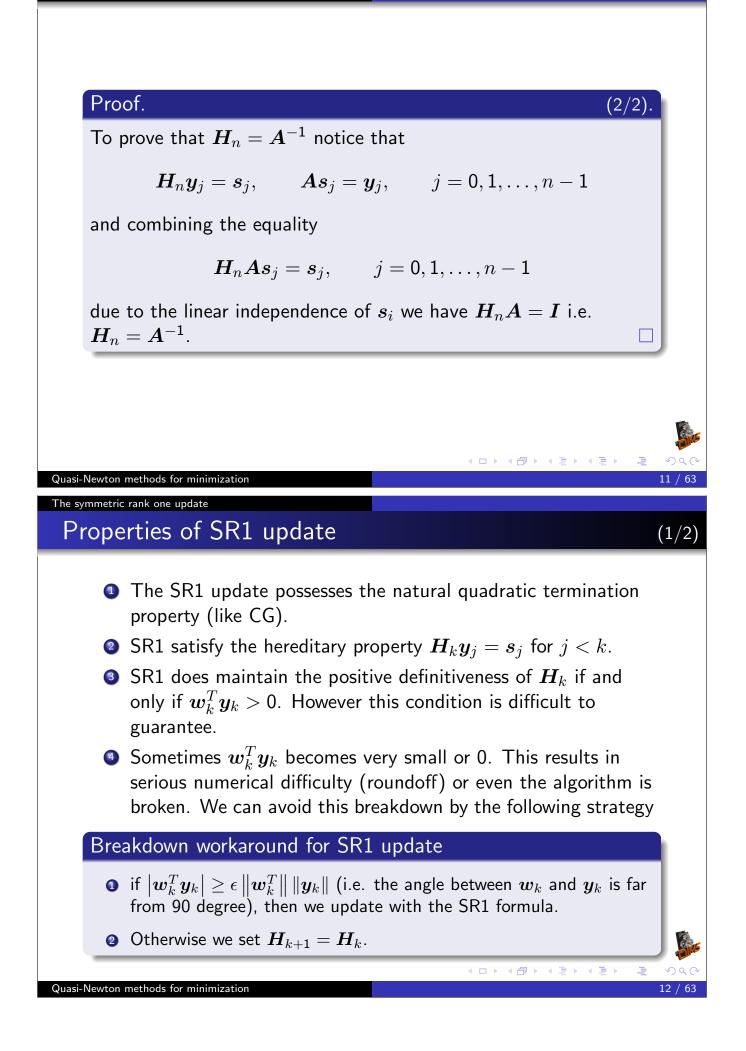

by the induction hypothesis for j < k and using lemma on slide 8 we have

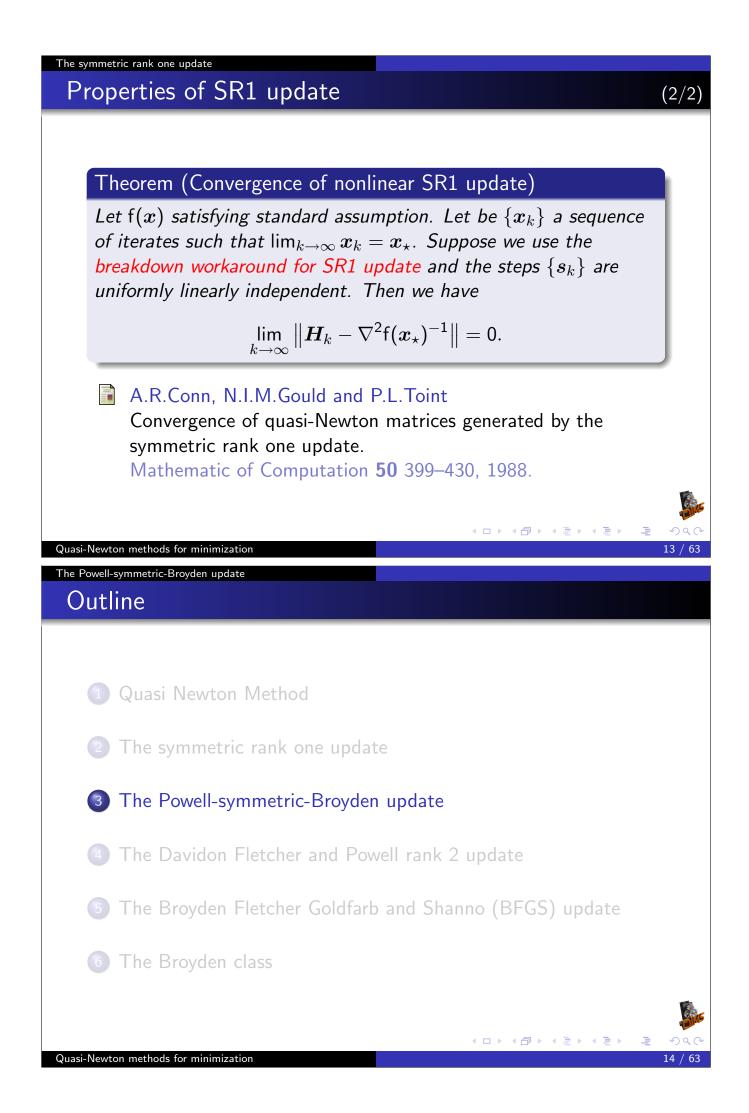

$$egin{aligned} oldsymbol{w}_k^Toldsymbol{y}_j &= oldsymbol{s}_k^Toldsymbol{y}_j - oldsymbol{y}_k^Toldsymbol{H}_koldsymbol{y}_j = oldsymbol{s}_k^Toldsymbol{y}_j - oldsymbol{y}_k^Toldsymbol{s}_j \ &= oldsymbol{y}_k^Toldsymbol{A}oldsymbol{y}_j - oldsymbol{y}_k^Toldsymbol{A}oldsymbol{y}_j = oldsymbol{0} \ &= oldsym$$

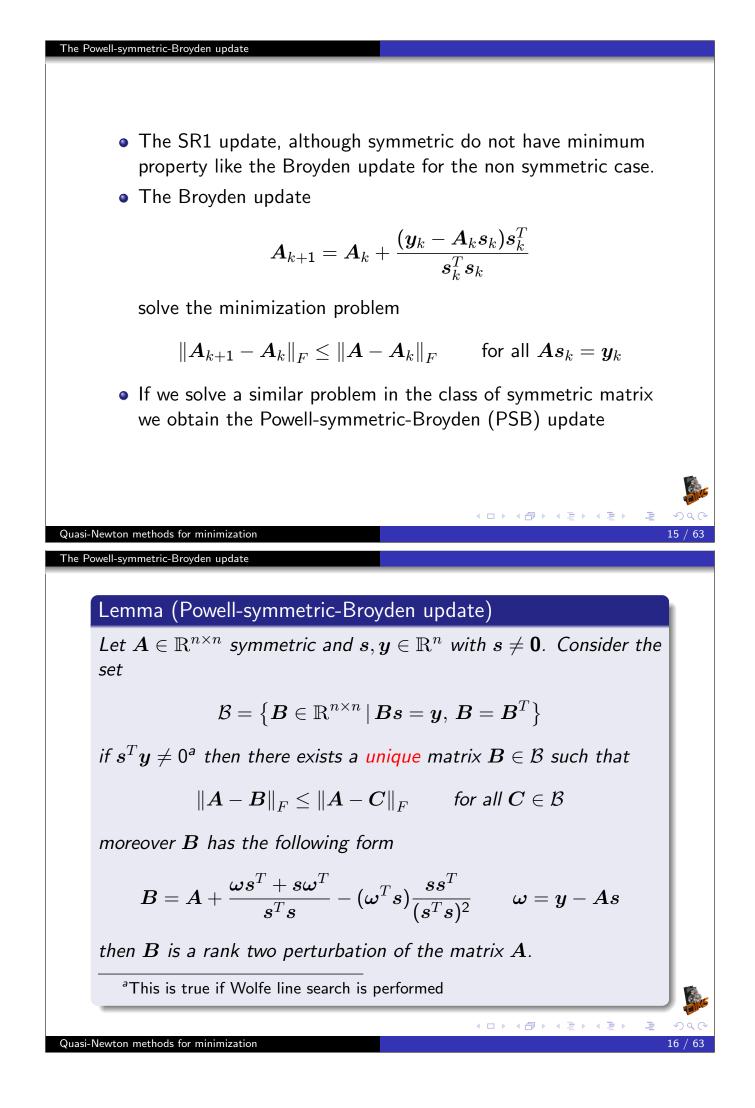

so that  $H_{k+1}y_j = H_ky_j = s_j$  for j = 0, 1, ..., k-1. For j = kwe have  $H_{k+1}y_k = s_k$  trivially by construction of the SR1 formula.

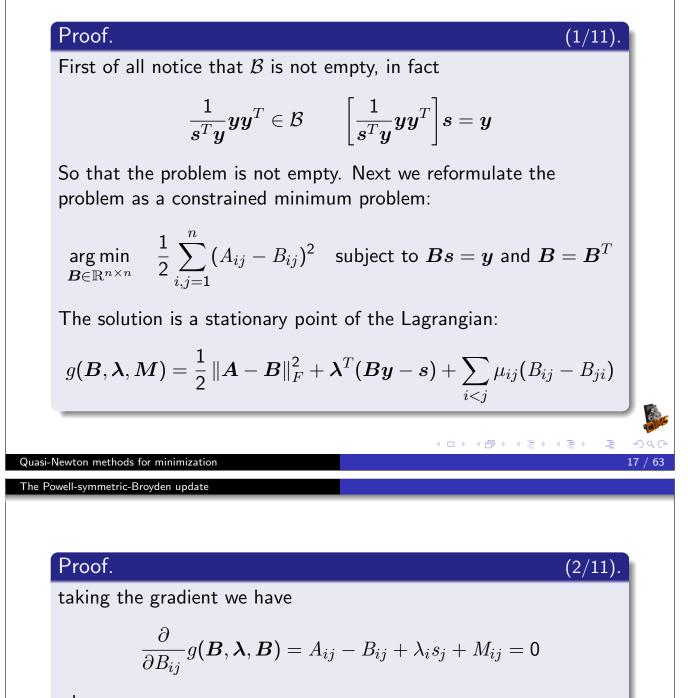

9 / 63

(1/2)

where

$$M_{ij} = \begin{cases} \mu_{ij} & \text{if } i < j; \\ -\mu_{ij} & \text{if } i > j; \\ 0 & \text{If } i = j. \end{cases}$$

The previous equality can be written in matrix form as

$$B = A + \lambda s^T + M.$$

・ロ・ ・ 日・ ・ ヨ・

Imposing symmetry for B

$$oldsymbol{A}+oldsymbol{\lambda}oldsymbol{s}^T+oldsymbol{M}=oldsymbol{A}^T+oldsymbol{s}oldsymbol{\lambda}^T+oldsymbol{M}^T=oldsymbol{A}+oldsymbol{s}oldsymbol{\lambda}^T-oldsymbol{M}$$

solving for M we have

$$M=rac{soldsymbol{\lambda}^T-oldsymbol{\lambda} s^T}{2}$$

substituting in  $\boldsymbol{B}$  we have

$$oldsymbol{B} = oldsymbol{A} + rac{oldsymbol{s}oldsymbol{\lambda}^T + oldsymbol{\lambda}oldsymbol{s}^T}{2}$$

 $\label{eq:Quasi-Newton methods for minimization} Quasi-Newton methods for minimization$ 

The Powell-symmetric-Broyden update

Proof.

Imposing  $s^T B s = s^T y$ 

$$egin{aligned} s^Tm{A}s + rac{s^Tsm{\lambda}^Ts + s^Tm{\lambda}s^Ts}{2} = s^Tm{y} &= \ & m{\lambda}^Ts = (s^T\omega)/(s^Ts) \end{aligned}$$

where  $\omega = y - As$ . Imposing Bs = y

$$As + rac{s oldsymbol{\lambda}^T s + oldsymbol{\lambda} s^T s}{2} = y \qquad \Rightarrow$$

$$oldsymbol{\lambda} = rac{2oldsymbol{\omega}}{s^Ts} - rac{(s^Toldsymbol{\omega})s}{(s^Ts)^2}$$

next we compute the explicit form of B.

19 / 63

20 / 63

(4/11).

< ロ > < 四 > < 三 > < 三 > 、

⇒

▲□▶ ▲圖▶ ▲필▶ ▲필▶ - 厘

#### Substituting

$$oldsymbol{\lambda} = rac{2oldsymbol{\omega}}{s^Ts} - rac{(s^Toldsymbol{\omega})s}{(s^Ts)^2} \qquad ext{in} \qquad oldsymbol{B} = oldsymbol{A} + rac{soldsymbol{\lambda}^T + oldsymbol{\lambda}s^T}{2}$$

we obtain

$$m{B} = m{A} + rac{m{\omega}m{s}^T + m{s}m{\omega}^T}{m{s}^Tm{s}} - (m{\omega}^Tm{s})rac{m{s}m{s}^T}{(m{s}^Tm{s})^2} \qquad m{\omega} = m{y} - m{A}m{s}$$

next we prove that B is the unique minimum.

Quasi-Newton methods for minimization

#### The Powell-symmetric-Broyden update

# Proof.

The matrix  $\boldsymbol{B}$  is a minimum, in fact

$$egin{aligned} \|m{B}-m{A}\|_F &= \left\|rac{m{\omega}m{s}^T+m{s}m{\omega}^T}{m{s}^Tm{s}} - (m{\omega}^Tm{s})rac{m{s}m{s}^T}{(m{s}^Tm{s})^2}
ight\|_F \end{aligned}$$

To bound this norm we need the following properties of Frobenius norm:

• 
$$\|\boldsymbol{M} - \boldsymbol{N}\|_F^2 = \|\boldsymbol{M}\|_F^2 + \|\boldsymbol{N}\|_F^2 - 2\boldsymbol{M} \cdot \boldsymbol{N};$$
  
where  $\boldsymbol{M} \cdot \boldsymbol{N} = \sum_{ij} M_{ij} N_{ij}$  setting

$$egin{aligned} M = rac{oldsymbol{\omega} s^T + s oldsymbol{\omega}^T}{s^T s} & egin{aligned} N = (oldsymbol{\omega}^T s) rac{s s^T}{(s^T s)^2} \end{aligned}$$

now we compute  $\|\boldsymbol{M}\|_F$ ,  $\|\boldsymbol{N}\|_F$  and  $\boldsymbol{M}\cdot\boldsymbol{N}.$

24 / 63

$$M \cdot N = \frac{\omega^T s}{(s^T s)^3} \sum_{ij} (\omega_i s_j + \omega_j s_i) s_i s_j$$

$$= \frac{\omega^T s}{(s^T s)^3} \sum_{ij} [(\omega_i s_i) s_j^2 + (\omega_j s_j) s_i^2)]$$

$$= \frac{\omega^T s}{(s^T s)^3} \left[ \sum_i (\omega_i s_i) \sum_j s_j^2 + \sum_j (\omega_j s_j) \sum_i s_i^2 \right]$$

$$= \frac{\omega^T s}{(s^T s)^3} \left[ (\omega^T s) (s^T s) + (\omega^T s) (s^T s) \right]$$

$$= \frac{2(\omega^T s)^2}{(s^T s)^2}$$

The Powell-symmetric-Broyden update

# Proof.

To bound  $\|N\|_F^2$  and  $\|M\|_F^2$  we need the following properties of Frobenius norm:

• 
$$\left\| \boldsymbol{u} \boldsymbol{v}^T \right\|_F^2 = (\boldsymbol{u}^T \boldsymbol{u}) (\boldsymbol{v}^T \boldsymbol{v});$$

• 
$$\left\| \boldsymbol{u} \boldsymbol{v}^T + \boldsymbol{v} \boldsymbol{u}^T \right\|_F^2 = 2(\boldsymbol{u}^T \boldsymbol{u})(\boldsymbol{v}^T \boldsymbol{v}) + 2(\boldsymbol{u}^T \boldsymbol{v})^2;$$

Then we have

$$egin{aligned} \|m{N}\|_F^2 &= rac{(\omega^T s)^2}{(s^T s)^4} \left\|ss^T
ight\|_F^2 = rac{(\omega^T s)^2}{(s^T s)^4} (s^T s)^2 = rac{(\omega^T s)^2}{(s^T s)^2} \ \|m{M}\|_F^2 &= rac{\omega s^T + s \omega^T}{s^T s} = rac{2(\omega^T \omega)(s^T s) + 2(s^T \omega)^2}{(s^T s)^2} \end{aligned}$$

Putting all together and using Cauchy-Schwartz inequality  $(a^T b \le ||a|| ||b||)$ :

$$egin{aligned} \|m{M}-m{N}\|_F^2 &= rac{(\omega^T s)^2}{(s^T s)^2} + rac{2(\omega^T \omega)(s^T s) + 2(s^T \omega)^2}{(s^T s)^2} - rac{4(\omega^T s)^2}{(s^T s)^2} \ &= rac{2(\omega^T \omega)(s^T s) - (\omega^T s)^2}{(s^T s)^2} \end{aligned}$$

$$\leq rac{oldsymbol{\omega}^Toldsymbol{\omega}}{oldsymbol{s}^Toldsymbol{s}} = rac{\|oldsymbol{\omega}\|^2}{\|oldsymbol{s}\|^2} \qquad ext{[used Cauchy-Schwartz]}$$

(9/11).

Using  $oldsymbol{\omega} = oldsymbol{y} - oldsymbol{As}$  and noticing that  $oldsymbol{y} = oldsymbol{Cs}$  for all  $oldsymbol{C} \in \mathcal{B}.$  so that

$$\|oldsymbol{\omega}\|=\|oldsymbol{y}-oldsymbol{A}s\|=\|(oldsymbol{C}s-oldsymbol{A}s\|=\|(oldsymbol{C}-oldsymbol{A})s\|$$

Quasi-Newton methods for minimization

The Powell-symmetric-Broyden update

#### Proof.

To bound  $\|(C - A)s\|$  we need the following property of Frobenius norm:

• 
$$\left\| Mx \right\| \leq \left\| M \right\|_F \left\| x \right\|;$$

in fact

$$egin{aligned} \|oldsymbol{M}oldsymbol{x}\|^2 &= \sum_i \Big(\sum_j M_{ij} s_j\Big)^2 \leq \sum_i \Big(\sum_j M_{ij}^2\Big) \Big(\sum_k s_k^2\Big) \ &= \|oldsymbol{M}\|_F^2 \|oldsymbol{s}\|^2 \end{aligned}$$

using this inequality

$$\|\boldsymbol{M} - \boldsymbol{N}\|_F \leq rac{\|\boldsymbol{\omega}\|}{\|\boldsymbol{s}\|} = rac{\|(\boldsymbol{C} - \boldsymbol{A})\boldsymbol{s}\|}{\|\boldsymbol{s}\|} \leq rac{\|\boldsymbol{C} - \boldsymbol{A}\|_F \|\boldsymbol{s}\|}{\|\boldsymbol{s}\|}$$
  
i.e. we have  $\|\boldsymbol{A} - \boldsymbol{B}\|_F \leq \|\boldsymbol{C} - \boldsymbol{A}\|_F$  for all  $\boldsymbol{C} \in \mathcal{B}$ .

### (11/11).

Let B' and B'' two different minimum. Then  $rac{1}{2}(B'+B'')\in\mathcal{B}$  moreover

$$\left\|oldsymbol{A}-rac{1}{2}(oldsymbol{B}'+oldsymbol{B}'')
ight\|_{F}\leqrac{1}{2}\left\|oldsymbol{A}-oldsymbol{B}'
ight\|_{F}+rac{1}{2}\left\|oldsymbol{A}-oldsymbol{B}''
ight\|_{F}$$

If the inequality is strict we have a contradiction. From the Cauchy–Schwartz inequality we have an equality only when  $A - B' = \lambda(A - B'')$  so that

$$oldsymbol{B}'-\lambdaoldsymbol{B}''=(1-\lambda)oldsymbol{A}$$

and

$$oldsymbol{B}'s-\lambdaoldsymbol{B}''s=(1-\lambda)oldsymbol{A}s \quad \Rightarrow \quad (1-\lambda)oldsymbol{y}=(1-\lambda)oldsymbol{A}s$$

but this is true only when  $\lambda = 1$ , i.e. B' = B''.

#### The Davidon Fletcher and Powell rank 2 update

 $\bullet$  Solving for  $\alpha$  and  $\beta$  the equation

$$\alpha(\boldsymbol{s}_k^T\boldsymbol{y}_k)\boldsymbol{s}_k + \beta(\boldsymbol{y}_k^T\boldsymbol{H}_k\boldsymbol{y}_k)\boldsymbol{H}_k\boldsymbol{y}_k = \boldsymbol{s}_k - \boldsymbol{H}_k\boldsymbol{y}_k$$

we obtain

$$lpha = rac{1}{oldsymbol{s}_k^Toldsymbol{y}_k} \qquad eta = -rac{1}{oldsymbol{y}_k^Toldsymbol{H}_koldsymbol{y}_k}$$

• substituting in the updating formula we obtain the Davidon Fletcher and Powell (DFP) rank 2 update formula

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k + rac{oldsymbol{s}_k oldsymbol{s}_k^T}{oldsymbol{s}_k^T oldsymbol{y}_k} - rac{oldsymbol{H}_k oldsymbol{y}_k oldsymbol{y}_k^T oldsymbol{H}_k}{oldsymbol{y}_k^T oldsymbol{H}_k oldsymbol{y}_k}$$

 Obviously this is only a possible choice and with other solution we obtain different update formulas. Next we must prove that under suitable condition the DFP update formula maintains positive definitiveness.

Quasi-Newton methods for minimization

The Davidon Fletcher and Powell rank 2 update

# Positive definitiveness of DFP update

## Theorem (Positive definitiveness of DFP update)

Given  $H_k$  symmetric and positive definite, then the DFP update

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k + rac{oldsymbol{s}_k oldsymbol{s}_k^T}{oldsymbol{s}_k^T oldsymbol{y}_k} - rac{oldsymbol{H}_k oldsymbol{y}_k oldsymbol{y}_k^T oldsymbol{H}_k}{oldsymbol{y}_k^T oldsymbol{H}_k oldsymbol{y}_k}$$

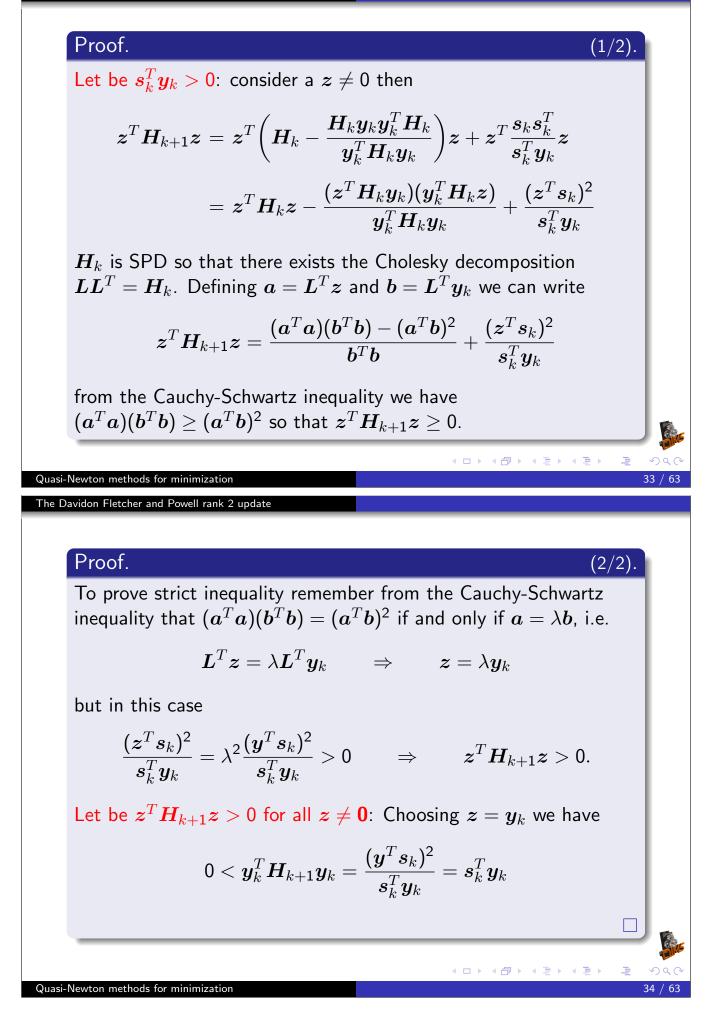

produce  $H_{k+1}$  positive definite if and only if  $s_k^T y_k > 0$ .

# Remark (Wolfe $\Rightarrow$ DFP update is SPD)

Expanding  $s_k^T y_k > 0$  we have  $\nabla f(x_{k+1})s_k > \nabla f(x_k)s_k$ . Remember that in a minimum search algorithm we have  $s_k = \alpha_k p_k$ with  $\alpha_k > 0$ . But the second Wolfe condition for line-search is  $\nabla f(x_k + \alpha_k p_k)p_k \ge c_2 \nabla f(x_k)p_k$  with  $0 < c_2 < 1$ . But this imply:

 $abla \mathsf{f}(oldsymbol{x}_{k+1})oldsymbol{s}_k \geq oldsymbol{c_2} 
abla \mathsf{f}(oldsymbol{x}_k)oldsymbol{s}_k > 
abla \mathsf{f}(oldsymbol{x}_k)oldsymbol{s}_k \quad \Rightarrow \quad oldsymbol{s}_k^Toldsymbol{y}_k > \mathsf{0}.$ 

The Davidon Fletcher and Powell rank 2 update

Algorithm (DFP quasi-Newton algorithm)

 $\begin{array}{l} k \leftarrow 0; \\ x \text{ assigned; } g \leftarrow \nabla \mathrm{f}(x); \ H \leftarrow \nabla^2 \mathrm{f}(x)^{-1}; \\ \text{while } \|g\| > \epsilon \text{ do} \\ \hline - \text{ compute search direction} \\ d \leftarrow Hg; \\ Approximate \ \arg\min_{\alpha>0} \mathrm{f}(x - \alpha d) \ by \ \text{linsearch}; \\ \hline - \text{ perform step} \\ x \leftarrow x - \alpha d; \\ \hline - \text{ update } H_{k+1} \\ y \leftarrow \nabla \mathrm{f}(x) - g; \ z \leftarrow Hy; \ g \leftarrow \nabla \mathrm{f}(x); \\ H \leftarrow H - \alpha \frac{dd}{d^T y} - \frac{z z^T}{y^T z}; \\ k \leftarrow k+1; \\ \text{end while} \end{array}$

```

## Theorem (property of DFP update)

Let be  $q(x) = \frac{1}{2}(x - x_*)^T A(x - x_*) + c$  with  $A \in \mathbb{R}^{n \times n}$ symmetric and positive definite. Let be  $x_0$  and  $H_0$  assigned. Let  $\{x_k\}$  and  $\{H_k\}$  produced by the sequence  $\{s_k\}$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ →

▲□▶ ▲圖▶ ▲厘▶ ▲厘≯

$$\begin{array}{c} \bullet \ x_{k+1} \leftarrow \ x_k + s_k, \\ \hline \\ \bullet \ H_{k+1} \leftarrow \ H_k + \frac{s_k s_k^T}{s_k^T y_k} - \frac{H_k y_k y_k^T H_k}{y_k^T H_k y_k}; \end{array}$$

where  $s_k = \alpha_k p_k$  with  $\alpha_k$  is obtained by exact line-search. Then for j < k we have

g<sup>T</sup><sub>k</sub>s<sub>j</sub> = 0; [orthogonality property]
H<sub>k</sub>y<sub>j</sub> = s<sub>j</sub>; [hereditary property]
s<sup>T</sup><sub>k</sub>As<sub>j</sub> = 0; [conjugate direction property]
The method terminate (i.e. ∇f(x<sub>m</sub>) = 0) at x<sub>m</sub> = x<sub>\*</sub> with m ≤ n. If n = m then H<sub>n</sub> = A<sup>-1</sup>.

35 / 63

#### The Davidon Fletcher and Powell rank 2 update

## Proof.

Points (1), (2) and (3) are proved by induction. The base of induction is obvious, let be the theorem true for k > 0. Due to exact line search we have:

$$oldsymbol{g}_{k+1}^Toldsymbol{s}_k={ t 0}$$

moreover by induction for j < k we have  $\boldsymbol{g}_{k+1}^T \boldsymbol{s}_j = 0$ , in fact:

$$egin{aligned} m{g}_{k+1}^T m{s}_j &= m{g}_j^T m{s}_j + \sum_{i=j}^{k-1} (m{g}_{i+1} - m{g}_i)^T m{s}_j \ &= 0 + \sum_{i=j}^{k-1} (m{A}(m{x}_{i+1} - m{x}_\star) - m{A}(m{x}_i - m{x}_\star))^T m{s}_j \ &= \sum_{i=j}^{k-1} (m{A}(m{x}_{i+1} - m{x}_i))^T m{s}_j \ &= \sum_{i=j}^{k-1} m{s}_i^T m{A} m{s}_j = 0. \quad & [ ext{induction} + ext{conjugacy prop.}] \end{aligned}$$

 $H_{k+}$ 

Due to DFP construction we have

 $\boldsymbol{H}_{k+1}\boldsymbol{y}_k = \boldsymbol{s}_k$ 

(3/4).

39 / 63

(4/4)

by inductive hypothesis and DFP formula for j < k we have,  $s_k^T y_j = s_k^T A s_j = 0$ , moreover

$$egin{aligned} & \mathbf{H}_k \mathbf{y}_j = \mathbf{H}_k \mathbf{y}_j + rac{\mathbf{s}_k \mathbf{s}_k^T \mathbf{y}_j}{\mathbf{s}_k^T \mathbf{y}_k} - rac{\mathbf{H}_k \mathbf{y}_k \mathbf{y}_k^T \mathbf{H}_k \mathbf{y}_j}{\mathbf{y}_k^T \mathbf{H}_k \mathbf{y}_k} \ & = \mathbf{s}_j + rac{\mathbf{s}_k \mathbf{0}}{\mathbf{s}_k^T \mathbf{y}_k} - rac{\mathbf{H}_k \mathbf{y}_k \mathbf{y}_k^T \mathbf{s}_j}{\mathbf{y}_k^T \mathbf{H}_k \mathbf{y}_k} \quad \quad \left[\mathbf{H}_k \mathbf{y}_j = \mathbf{s}_j
ight] \end{aligned}$$

$$= m{s}_j - rac{m{H}_k m{y}_k (m{g}_{k+1} - m{g}_k)^T m{s}_j}{m{y}_k^T m{H}_k m{y}_k} \qquad [m{y}_j = m{g}_{j+1} - m{g}_j]$$

< P

<ロ> (四) (四) (三) (三)

 $= s_j$  [induction + ortho. prop.]

Quasi-Newton methods for minimization

The Davidon Fletcher and Powell rank 2 update

## Proof.

Finally if m = n we have  $s_j$  with j = 0, 1, ..., n-1 are conjugate and linearly independent. From hereditary property and lemma on slide 8

$$oldsymbol{H}_noldsymbol{A}oldsymbol{s}_k=oldsymbol{H}_noldsymbol{y}_k=oldsymbol{s}_k$$

i.e. we have

$$H_n A s_k = s_k, \qquad k = 0, 1, \dots, n-1$$

due to linear independence of  $\{s_k\}$  follows that  $H_n = A^{-1}$ .

 Starting from the Davidon Fletcher and Powell (DFP) rank 2 update formula

$$oldsymbol{H}_{k+1} \leftarrow oldsymbol{H}_k + rac{oldsymbol{s}_k oldsymbol{s}_k^T}{oldsymbol{s}_k^T oldsymbol{y}_k} - rac{oldsymbol{H}_k oldsymbol{y}_k oldsymbol{y}_k^T oldsymbol{H}_k}{oldsymbol{y}_k^T oldsymbol{H}_k oldsymbol{y}_k}$$

by the duality we obtain the Broyden Fletcher Goldfarb and Shanno (BFGS) update formula

$$oldsymbol{B}_{k+1} \leftarrow oldsymbol{B}_k + rac{oldsymbol{y}_k oldsymbol{y}_k^T}{oldsymbol{y}_k^T oldsymbol{s}_k} - rac{oldsymbol{B}_k oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{B}_k}{oldsymbol{s}_k^T oldsymbol{B}_k oldsymbol{s}_k},$$

• The BFGS formula written in this way is not useful in the case of large problem. We need an equivalent formula for the inverse of the approximate Hessian. This can be done with a generalization of the Sherman-Morrison formula.

(1/4).

Quasi-Newton methods for minimization

The Broyden Fletcher Goldfarb and Shanno (BFGS) update

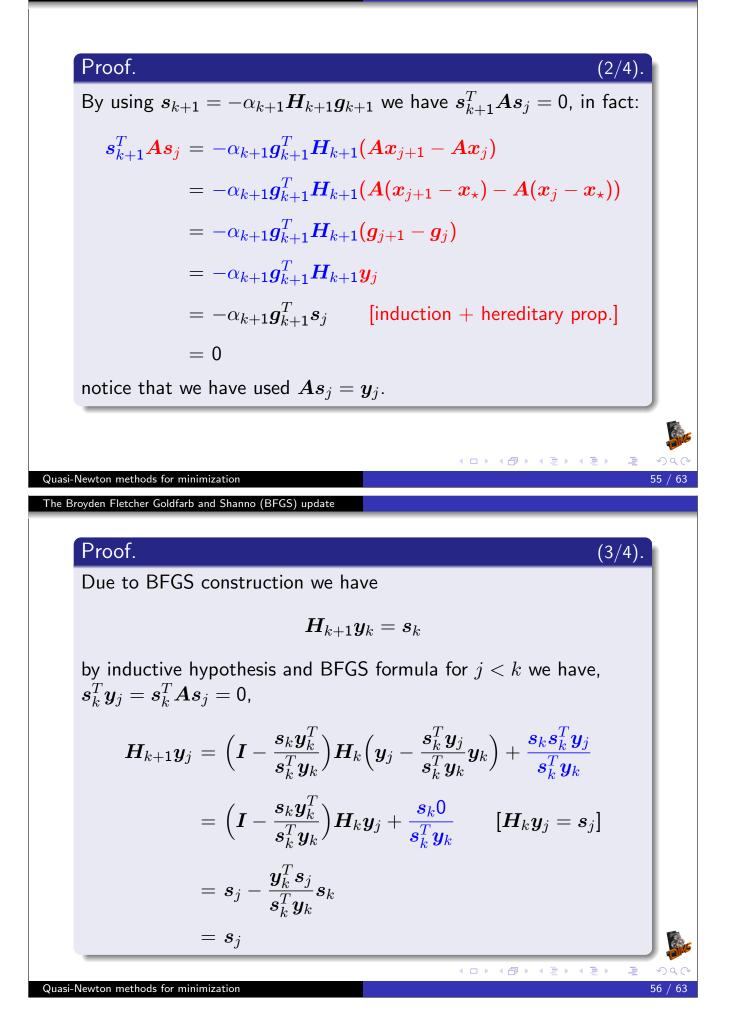

### Proof.

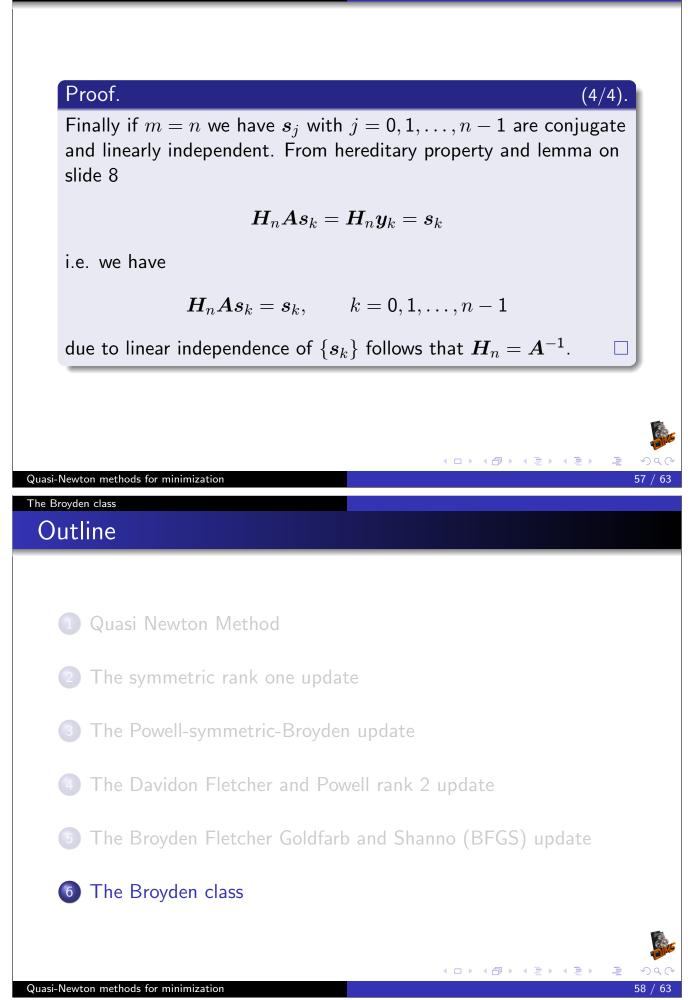

Points (1), (2) and (3) are proved by induction. The base of induction is obvious, let be the theorem true for k > 0. Due to exact line search we have:

$$oldsymbol{g}_{k+1}^Toldsymbol{s}_k=0$$

moreover by induction for j < k we have  $g_{k+1}^T s_j = 0$ , in fact:

$$egin{aligned} egin{aligned} egin{aligne} egin{aligned} egin{aligned} egin{aligned} egin$$

• The DFP update

$$oldsymbol{H}_{k+1}^{BFGS} \leftarrow oldsymbol{H}_k - rac{oldsymbol{H}_k oldsymbol{y}_k oldsymbol{s}_k^T + oldsymbol{s}_k oldsymbol{y}_k^T oldsymbol{H}_k}{oldsymbol{s}_k^T oldsymbol{y}_k} + rac{oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{s}_k}{oldsymbol{s}_k^T oldsymbol{y}_k} + rac{oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{s}_k}{oldsymbol{s}_k^T oldsymbol{y}_k} + rac{oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{s}_k}{oldsymbol{s}_k^T oldsymbol{y}_k} + orac{oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{s}_k}{oldsymbol{s}_k^T oldsymbol{y}_k} + orac{oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{s}_k}{oldsymbol{s}_k^T oldsymbol{s}_k} + orac{oldsymbol{s}_k oldsymbol{s}_k}{oldsymbol{s}_k} oldsymbol{s}_k} + orac{oldsymbol{s}_k oldsymbol{s}_k oldsymbol{s}_k}{oldsymbol{s}_k^T oldsymbol{s}_k} oldsymbol{s}_k} + oldsymbol{s}_k oldsymbol{s}_k^T oldsymbol{s}_k} oldsymbol{s}_k oldsymbol{s}_k oldsymbol{s}_k} + oldsymbol{s}_k ol$$

and BFGS update

$$oldsymbol{H}_{k+1}^{DFP} \leftarrow oldsymbol{H}_k + rac{oldsymbol{s}_k oldsymbol{s}_k^T}{oldsymbol{s}_k^T oldsymbol{y}_k} - rac{oldsymbol{H}_k oldsymbol{y}_k oldsymbol{y}_k^T oldsymbol{H}_k}{oldsymbol{y}_k^T oldsymbol{H}_k oldsymbol{y}_k}$$

maintains the symmetry and positive definitiveness.

• The following update

$$oldsymbol{H}_{k+1}^{ heta} \leftarrow (1- heta)oldsymbol{H}_{k+1}^{DFP} + hetaoldsymbol{H}_{k+1}^{BFGS}$$

maintain for any  $\theta$  the symmetry, and for  $\theta \in [0, 1]$  also the positive definitiveness.

Quasi-Newton methods for minimization

The Broyden class

# Positive definitiveness of Broyden Class update

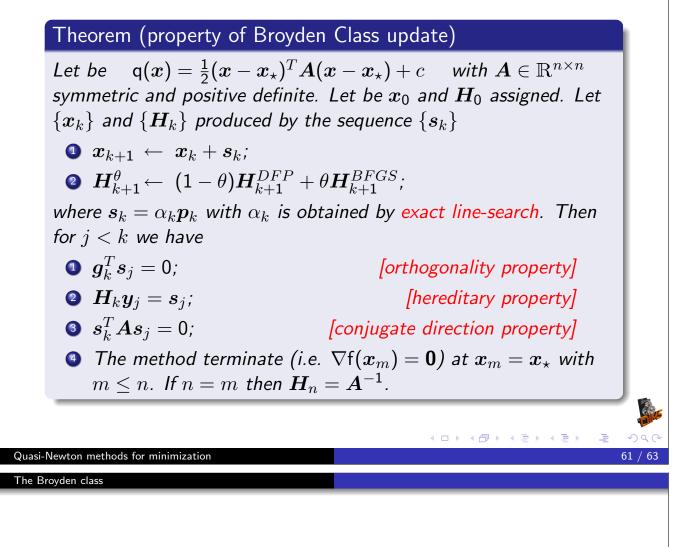

Theorem (Positive definitiveness of Broyden Class update)

Given  $H_k$  symmetric and positive definite, then the Broyden Class update

$$oldsymbol{H}_{k+1}^{ heta} \leftarrow (1- heta)oldsymbol{H}_{k+1}^{DFP} + hetaoldsymbol{H}_{k+1}^{BFGS}$$

produce  $H_{k+1}^{\theta}$  positive definite for any  $\theta \in [0,1]$  if and only if  $s_k^T y_k > 0$ .

59

• The Broyden Class update canbe written as

$$egin{aligned} oldsymbol{H}_{k+1}^{ heta} &= oldsymbol{H}_{k+1}^{DFP} + heta oldsymbol{w}_k oldsymbol{w}_k^T \ &= oldsymbol{H}_{k+1}^{BFGS} + ( heta-1) oldsymbol{w}_k oldsymbol{w}_k^T \end{aligned}$$

where

$$oldsymbol{w}_k = ig(oldsymbol{y}_k^Toldsymbol{H}_koldsymbol{y}_kig)^{1/2} \Big[rac{oldsymbol{s}_k}{oldsymbol{s}_k^Toldsymbol{y}_k} - rac{oldsymbol{H}_koldsymbol{y}_k}{oldsymbol{y}_k^Toldsymbol{H}_koldsymbol{y}_k}\Big]$$

< 口 > < 同 >

- For particular values of  $\theta$  we obtain
  - $\theta = 0$ , the DFP update
  - 2  $\theta = 1$ , the BFGS update

  - 3  $\theta = s_k^T y_k / (s_k H_k y_k)^T y_k$  the SR1 update 4  $\theta = (1 \pm (y_k^T H_k y_k / s_k^T y_k))^{-1}$  the Hoshino update
